

Used Forklift Parts

Used Forklift Parts - Without doubt, lift truck components would eventually wear out and require replacing. The option of purchasing brand new parts can become costly so another idea is to acquire used components. This could save much money in the end. It is a good idea to obtain used lift truck components which have been reproduced. These parts would guarantee that you are getting components which will work for a long time and be productive.

Remanufacturing broken and worn out parts is a cheaper method overall than rebuilding. With rebuilding parts, only the components which are worn out or broken get replaced, which means that other wearable components might break down soon after purchase.

Remanufactured components are cleaned after being taken apart and have the unusable parts replaced. This technique can offer the best assurance for second-hand parts. All wearable components are replaced regardless of age or wear which is one more rationale why remanufactured parts on the whole function so much better. Any part within the part is brand new and this provides far longer life to the used part. Based on the forklift components that are being redone, the cleaning process and the complete remanufacturing process would vary.

After complete disassembly, the engines are oven cleaned. Different parts of the engine such as spark plugs, pistons, rings, valves, valve springs, and filters can be replaced during the remanufacture process. The engines are hot tested after reassembly to ensure that there are no oil pressure problems, no leaks, noises or any vacuum.

Transmissions are pressure washed, disassembled and oven cleaned. A comprehensive inspection is performed in order to check for any cracks. Bearings, bushings and seals are all replaced. Usually, the replacement components utilized on transmission parts meet OEM specifications.

Some forklift components such as torque converters, the alternator, the water pump, the starter and steer axles could be quite serviceable after worn components are replaced. The electronic control in the electric forklift is maintained by the control card. This particular card can also be remanufactured with replacing all aged and worn out components. Unlike other forklift components the control card could only have the worn and aged components replaced.

Parts which are reproduced have to be comprehensively inspected upon reassembly to ensure they are in good condition before being sold. When buying these parts, it is a good idea to be certain that they have undergone all of the proper testing and inspections. On certain larger components such as transmissions, steer axles and engines, OEM specification replacement parts should be used.

The dealer of used lift trucks and parts can guarantee that the reproduced parts have met OEM specifications and that these parts meet industry standards. A lot of details go into remanufacturing second-hand components. This attention to detail offers more serviceability out of reproduced parts opposed to the parts that were merely rebuilt.
